

Embedding a Form into a website

Last Modified on 06/02/2022 9:11 am PDT

Forms created within your Activities can be embedded into your website so that the URL indicates that the supporter is still within your website. It does this using the iFrame HTML functionality.

Embedding refers to the the practice of having one web page being opened while in (embedded in) another webpage. This gives the impression that the embedded webpage is not a completely separate page, but just a component of the other webpage. The URL of the embedded page does not appear, so the experience for your supporter is that they do not leave your site.

While this process should be relatively easy to do, if this is too complex, you can also simply use the links found in the Display Links section of the Activity.

Note: *It is highly recommended that you use a secure webpage (SSL or https://) for your donation form.* If you put the donation form on an insecure site, your supporters may suspect that it is not a legitimate page or the browser may block access to filling in the form. While the form page itself IS secure, embedding it in an insecure page will make it *appear* to be insecure.

Talk with your webmaster about getting SSL on your webpage.

If you cannot get SSL or while it is in the works, it is recommended to simply link out to your GiveSmart Fundraise form instead of embedding it.

Embedding a form

When you design the form within your Activity, the last section is the **Embed Code**. Open this section to find the **Form Embed** code.

Embed Code

Form Embed

Embed this code to place a secure form on your web site 

```
<iframe id="mc-donation" src="https://app.mobilecause.com/form/b-izpw?utm_source=embed&utm_medium=page&utm_campaign=general" width="100%" height="1666" overflow="scroll" onLoad="window.scrollTo(0,0);"></iframe>
```

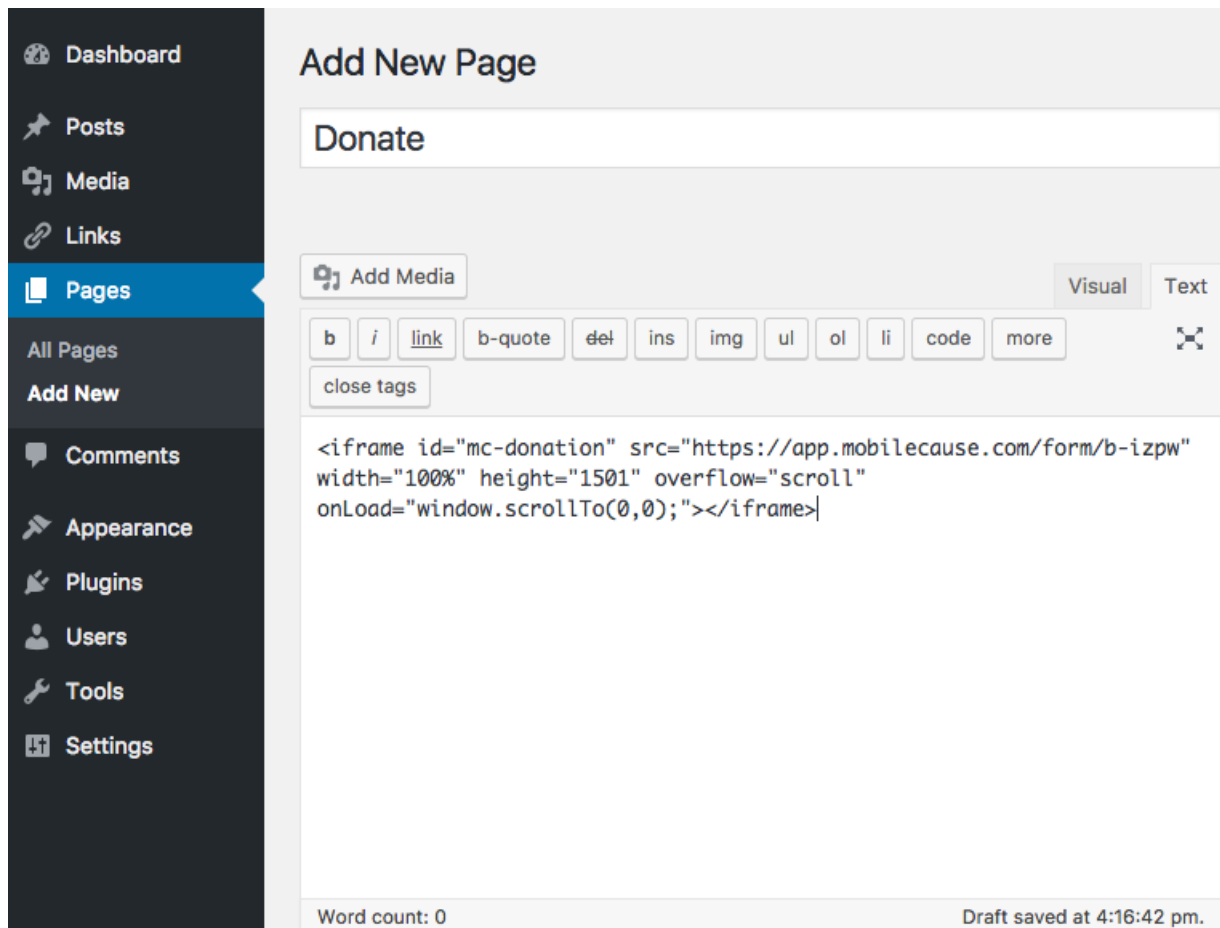

To change the size of this online form, edit the height and width dimensions within the Embed Code.

Copy and Paste the embed code (starting with "<iframe " into the HTML of a page on your

website. The code is designed for a typical design for an embedded page, so you should be able to just paste it into the page.

If you have a web designer who understands the functionality of the iframe, they can adjust the width, the height and the overflow to change the experience using the embedded form.

Example WordPress HTML editor

The screenshot shows the WordPress 'Add New Page' editor interface. On the left is a dark sidebar with navigation options: Dashboard, Posts, Media, Links, Pages (highlighted), All Pages, Add New, Comments, Appearance, Plugins, Users, Tools, and Settings. The main content area is titled 'Add New Page' and contains a text input field with the word 'Donate'. Below the input field is an 'Add Media' button and two tabs: 'Visual' and 'Text'. The 'Text' tab is active, showing a rich text editor toolbar with buttons for bold (b), italic (i), link, quote (b-quote), delete (del), insert (ins), image (img), list (ul, ol, li), code, and more. A 'close tags' button is also present. The main text area contains the following HTML code:

```
<iframe id="mc-donation" src="https://app.mobilecause.com/form/b-izpw" width="100%" height="1501" overflow="scroll" onLoad="window.scrollTo(0,0);"></iframe>
```

 At the bottom of the editor, it shows 'Word count: 0' and 'Draft saved at 4:16:42 pm.'

Embed a different donation page: You can replace the src= link in the code to embed any donation page from your GiveSmart Fundraise account.

```
<iframe id="mc-donation" src="https://app.mobilecause.com/form/b-izpw" width="100%" height="1501" overflow="scroll" onLoad="window.scrollTo(0,0);"></iframe>
```

Note: Every website is a little different. You will need to work with your webmaster to correct any spacing issues on the page of your embedded donation form.
